

🍪 Accept Cookies

- **Cookies** = **small text files** ($\leq 4\text{KB}$) stored in your **browser**
- **Sent** via HTTP headers in **every request/response**
- Help **websites “remember” you**
- Example: **“Remember Me” on GitHub** → session stored in a cookie.

🍪 Types of Cookies

1 Essential (Required)

- **Login sessions**
- Shopping cart
- **Language preferences**
- Website won't function without them

2 Analytics

- Track **page views, time spent, clicks**
- Help improve product
- Collect browsing behavior data

3 Marketing

- **Track you** across websites
- Build interest profile
- Show **targeted ads**

4 Third-Party

- Set by **other domains** (ads, social media)
- Enable **cross-site tracking**
- Being phased out by major browsers

✅ When you click “Reject All”

- the website's consent system should **block third-party scripts** (like ads or analytics).
- If the **ad script** (e.g., from Google) is **not loaded**, your browser never contacts Google.
- If there is no request, Google **cannot send a Set-Cookie** header.
- If **no Set-Cookie** is received → **no cookie is stored** in your browser.
- If no cookie is stored → nothing will be sent later for tracking.
- BUT if the **site loads the ad script** anyway (bad implementation), the **cookie** may still get **stored**.

✅ When to Accept

1. **Trusted sites** (GitHub, AWS, company tools)
2. When you want **personalization** (Netflix, Spotify)
3. **Essential cookies** are usually **safe & necessary**
